

Two in One – Laminator for Hot and Cold Applications “Made by NESCHEN“

Bueckeberg, 08. May 2017

- NESCHEN laminator update ahead of schedule
- New all-round talent for hot and cold lamination will be launched at FESPA 2017, to a global network of customers
- Demanding hot lamination with high operating speed

The success of the NESCHEN laminator series is ahead of schedule. Starting at FESPA in Hamburg the next model HotLam DoubleH 1650 is going to be distributed worldwide. With that, NESCHEN Coating presents the new premium model only one year after the very successful sales launch at last year’s FESPA in Amsterdam and thus earlier than initially planned. ‘We were really surprised by this fast sales success of our laminators „Made by Neschen“. However, this was a great motivation for our development department to make our new flagship market ready earlier than originally planned. Thanks to the great teamwork and some extra shifts we will set standards in hybrid lamination worldwide with HotLam 1650 DoubleH from May onwards’, commented Stephan Liegerer, Head of Technical Service Laminators at NESCHEN.

Neschen HotLam 1650 DoubleH is a real all-rounder which has been very well received during the test phase by advertising engineers and digital print service providers worldwide. Designed for the professional user, this machine features demanding hot lamination and a high operating speed.

Due to the two independent pairs of rollers, the user can quickly change between hot and cold lamination without waiting for the machine to "cool down".

The maximum speed of 8metre per minute makes the Hotlam DoubleH one of the fastest laminators available.

With a maximum working width of 1650mm, the DoubleH can process both Heat Activated and Pressure Sensitive Lamination Films.

As usually expected, also with the new model NESCHEN focused on easy operability for the customer. Therefore, apart from the two roller pairs, the new HotLam 1650 DoubleH offers the usual user-friendly product properties. The swing-out material supply provides for fast material load. An extractable infeed table enables easy feeding of individual prints up to 10 m. The new NESCHEN model has also an ergonomic and user-friendly control panel at the front of the machine
